

# Breaking the Routine: Events to Complement Informatics Olympiad Training

Benjamin Burton (Australia)

IOI 2008

Training schools in Australia are built around *lectures*, *laboratories*, *contests* and *task discussions*.

Here we focus on additional “extra” events:

- *Codebreakers* (finding counterexamples)
- *B-sessions* (focus on implementation)
- *Team events* (teamwork and puzzles)

# Codebreakers

## Motivation:

- Most discussions focus on *correct* algorithms
- Students should be able to identify *incorrect* algorithms
- Students should be able to generate pathological test cases

## Structure:

- Online contest with live scoreboard
- Students receive  $\sim 3$  tasks,  $\sim 15$  bad solutions
- Students submit input files to break these solutions

## Scoring:

- +10 if the input file breaks the solution
- -1 if the input file does not break the solution
- -2 if the input file is invalid
- Unlimited number of attempts allowed

# Codebreakers: Example

## Codebreaker Submissions for Bernard Blackham

---

[Log out](#)

Below is a list of all problems and source files for this codebreaker.

Problem	Source	Score out of 10	Attempts	Actions
<a href="#">1. Wetlands</a>	<a href="#">wetlands1.java</a>	10 (success!)	1	<a href="#">View submissions</a>
	<a href="#">wetlands2.c</a>	10 (success!)	1	<a href="#">View submissions</a>
	<a href="#">wetlands3.cpp</a>	8 (success!)	2	<a href="#">View submissions</a>
<a href="#">2. Mansion</a>	<a href="#">mansion1.cpp</a>			<a href="#">Break!</a>
	<a href="#">mansion2.cpp</a>	8 (success!)	2	<a href="#">View submissions</a>
	<a href="#">mansion3.cpp</a>			<a href="#">Break!</a>
	<a href="#">mansion4.c</a>	10 (success!)	1	<a href="#">View submissions</a>
<a href="#">3. Invasion</a>	<a href="#">invasion1.cpp</a>	8 (success!)	2	<a href="#">View submissions</a>
	<a href="#">invasion2.cpp</a>	-1	1	<a href="#">Break!</a>
	<a href="#">invasion3.cpp</a>			<a href="#">Break!</a>
	<a href="#">invasion4.pas</a>			<a href="#">Break!</a>
	<a href="#">invasion5.cpp</a>			<a href="#">Break!</a>
<a href="#">4. Restaurants</a>	<a href="#">restaurant1.cc</a>	9 (success!)	2	<a href="#">View submissions</a>
	<a href="#">restaurant2.py</a>	-3	3	<a href="#">Break!</a>
	<a href="#">restaurant3.cpp</a>	10 (success!)	1	<a href="#">View submissions</a>
	<a href="#">restaurant4.cc</a>	10 (success!)	1	<a href="#">View submissions</a>

Your total score for the codebreaker so far is 79.

# Codebreakers: Selecting Tasks and Solutions

## Tasks:

- Students already know the tasks
- Often taken from a recent national contest

## Bad solutions:

- Code is clear and readable (not obfuscated)
- Different solutions fail in different scenarios

## Types of errors:

- Implementation errors (e.g.,  $<$  becomes  $\leq$ )
- Algorithmic errors (e.g., incorrect greedy solution)
- Comprehension errors (solves a slightly different task)

## Motivation:

- Many students sloppy with implementation
- Some students afraid to code up complex algorithms
- Some students reluctant to attempt difficult tasks

## Structure:

- One difficult problem is handed out the day before
- Students meet for one hour to discuss the solution
- Students implement this solution in  $2\frac{1}{2}$  hours, exam conditions

Clear separation of *algorithms* and *implementation*.

# Team Events

## Motivation:

- To encourage teamwork
- To expose students to other areas in computer science
- To spend an afternoon doing something noisy and fun!

## Structure:

- Choose a topic (e.g., classical cryptography and cryptanalysis)
- Begin with a one-hour lecture on this topic
- Teams are given a series of puzzles to solve in the lab (e.g., coded messages to decrypt)
- The final puzzle shows the location of a hidden prize

# Conclusion

Different types of events can work well in training schools:

- Break the usual routine
- Develop different skills
- Introduce students to new topics

Conference paper contains details and technical requirements.

More suggestions are welcome!
